

Angular / TypeScript Exam Preparation

Practice questions and answers for Angular, TypeScript, Signals, Components, CLI, Binding, and Control Flow.

Part 1 — Multiple Choice Questions

1. What is Angular?

- A) Database
- B) Framework
- C) Browser
- D) CSS library

2. Angular is primarily built with:

- A) Java
- B) Python
- C) TypeScript
- D) PHP

3. What does @Component do?

- A) Creates database
- B) Marks class as Angular component
- C) Starts server
- D) Creates route

4. Which property defines custom HTML tag name?

- A) template
- B) selector
- C) styles
- D) signal

5. What does {{ title }} represent?

- A) Event binding
- B) Property binding
- C) Interpolation
- D) Signal update

Part 2 — Fill in the Blanks

1. `count = _____(0);`

2.

{{ _____ }}

3.

[src]="imageUrl"

4.

(click)="increment()"

5.

[(ngModel)]="name"

6.

this.count._____(0);

7.

this.count._____(n => n + 1);

8.

double = _____(() => this.count() * 2);

9.

ng _____ my-app

10.

ng _____

Part 3 — Open Questions

1. What is a component in Angular?

2. Explain interpolation and property binding.

3. Explain event binding and two-way binding.

4. What is signal() in Angular?

5. Explain .set() and .update().

6. What does computed() do?

Answers

Multiple Choice Answers

1. B
2. C
3. B
4. B
5. C

Fill in the Blanks Answers

1. signal
2. count()
3. [src]
4. (click)
5. [(ngModel)]
6. set
7. update
8. computed
9. new
10. serve

Open Question Key Points

- Component = class + template + styles.
- Interpolation displays data with {{ }}. Property binding uses [property].
- Event binding uses (click). Two-way binding uses [(ngModel)].
- signal() creates reactive state.
- .set() replaces value; .update() changes value based on previous value.
- computed() creates derived reactive value.
